TRASMISSIONE CON CATENE A RULLI TRANSMISSION WITH ROLLER CHAINS

L'importanza della lubrificazione, è uno dei principali fattori per la determinazione delle prestazioni e durata della trasmissione con catena a rulli.

Una corretta lubrificazione, consente maggiore efficacia nella trasmissione del moto, e se effettuata ad intervalli regolari, ne determinerà una durata maggiore. Di contro, una scorretta manutenzione, pregiudicherà il funzionamento e nonostante l'efficacia del migliore dei progetti, anche la sua più semplice delle funzioni: la durata.

L'usura che si viene a creare fra perno e la bussola, determina la causa che si conclude con l'allungamento della catena.

Per ovviare a questo problema, si è provveduto a creare un interstizio, tra la piastra della maglia interna e la piastra della maglia esterna. Una corretta lubrificazione, provvederà a "colmare" questa specie d'intercapedine, che riceverebbe così l'olio necessario ad una corretta lubrificazione. Il velo d'olio che si verrebbe a creare, nel contatto fra le parti di cui sopra, se debitamente "rabboccato" provvederà ad aumentare la durata della catena stessa, diminuendo al tempo stesso la rumorosità della trasmissione.

*One of the most important factors to determine performances and life of a transmission with roller chains, is the **lubrication**.*

A good and correct lubrication enables a greater efficacy in motion and when regularly repeated, a longer life. On the other hand, an incorrect upkeep compromises functioning and life.

***The wear** existing between the pin and the sleeve, determines the cause that ends in chain extension. To avoid this problem, a "space", between the plate of the inner plate and the plate of the outer plate has been created.*

A correct lubrication helps to fill this space in, in this way oil is enough to guarantee a correct working. The veil of oil created by the contact between the above parts, when duly topped up, increases the life and decreases the noisiness of the transmission.

Gli oli consigliabili sono quelli d'elevata qualità. È inutile utilizzare grassi od oli particolarmente ricchi. La caratteristica che fa diventare ottima, una buona lubrificazione, è dettata da una buona viscosità dell'olio impiegato, nonché dalla temperatura standard dell'ambiente nel quale lavora la catena.

Per questo ulteriore motivo, esistono degli oli, in grado di lavorare a temperature particolarmente elevate. È tuttavia consigliabile, per questo capitolo, affidarsi alle specifiche raffigurate nel riquadro presente in questa introduzione.

Suggested oils are those of high quality, it is useless using grease or oils particularly rich.

A good lubrication becomes excellent when the oil has a good viscosity and when the temperature of surroundings is standard.

For this reason some oils are able to perform with very high temperatures: to have more details, see the specifications expressed in the panel of this introduction.

Temperatura °C <i>Temperature</i>		Lubrificante consigliato <i>Recommended lubricant</i>
Da / From -6	a / to +5	SAE 20
Da / From +5	a / to +38	SAE 30
Da / From +38	a / to +49	SAE 40
Da / From +49	a / to +60	SAE 50

I metodi di lubrificazione, tuttavia, sono indispensabili, ed in quest'ottica, "ITC", ne consiglia alcuni fondamentali.

Lubrificazione manuale.

L'olio viene applicato mediante pennello o nebulizzatore, nell'interstizio esistente fra il rullo della catena ed il perno. Sarà applicato a cicli di circa 8/10 ore, od ad intervalli minori se l'applicazione por tasse le par ti a seccarsi anticipatamente.

Lubrication methods are essential, for this reason "ITC" advises some of them.

Manual lubrication.

The oil is applied by a brush or a nebulizer inside the space between the roller of the chain and the pin. The application has to be repeated every 8/10 hours, this cycle can be shorter if the application causes advanced drying of the parts.

Lubrificazione a goccia.

Può avvenire utilizzando un dispositivo automatico programmabile. Tuttavia quest'applicazione è consigliata qualora la trasmissione non superi la velocità periferica di circa 3 m/sec.

Drip-feed lubrication.

By using an automatic device predisposed to programming. This application is recommended only when the transmission doesn't exceed the peripheral speed of 3 m/sec.

Lubrificazione a bagno d'olio.

È la più semplice, dopo la lubrificazione manuale. La catena, installata all'interno di un carter, nella sua parte inferiore è a contatto con bagno d'olio, il cui livello massimo, non dovrà superare nel suo livello minimo, la mezzzeria della catena medesima.

La velocità massima consigliata per questo tipo d'applicazione, è di circa 7/8 m/sec.

Bath oil lubrication.

This is the easiest after the manual one. The chain, assembled inside a carter, has its lower part in a bath oil: the maximum level doesn't have to exceed the minimum level of the center line of the chain.

Suggested speed for this kind of chain is about 7/8 m/sec.

**Lubrificazione forzata.**

Metodo assai indicato per velocità d'esercizio particolarmente elevate (almeno 8-9 m/sec).

Mediante una pompa, collegata ad un sistema centrale di lubrificazione, il getto d'olio viene direttamente orientato sulle superfici interne della catena. Il tutto, è preferibile avvenga nel punto più in basso dell'ingranamento.

Pressure lubrication.

This lubrication is suitable for very high speeds (at least 8/9 m/sec). By a pump, that is connected to a central system of lubrication, the oil is directly injected to inner surfaces of chain.

This should preferably happen in the lowest part of the gear.

FORMULARIO DI BASE, PER IL CALCOLO DELLE TRASMISSIONI A CATENA **BASIC FORMULARY TO CALCULATE TRANSMISSIONS WITH CHAIN**

La determinazione dello sforzo motore, che si viene a creare nei trasportatori e negli elevatori a catena, sono da sempre oggetto di studio specifico, per una giusta determinazione e progettazione della trasmissione con catene a rulli. Sollecitazioni, torsioni varie e flessioni, sono il problema iniziale da riscontrare e se possibile da neutralizzare, già in fase di progettazione.

Qui di seguito, elenchiamo il significato di simboli e lettere, impiegati nelle formule sotto riportate:

α = angolo d'inclinazione dell'elevatore o del trasportatore
 C = trazione aggiuntiva necessaria allo scorrimento di tapparelle o tazze
 F = coefficiente d'attrito radente, tra catene e guide (vedere tabella)
 RF = coefficiente d'attrito volvente (vedere tabella)

F1 = coefficiente d'attrito radente tra il materiale da trasportare, sabbia, polvere di vetro, carboni, ecc. ed i canali dei trasportatore

L = lunghezza del ramo del trasportatore o dell'elevatore tra il centro dell'albero della ruota comando e quella denominata "rinvio", espressa in metri

P = è lo sforzo periferico espresso in kg. Agisce sulla circonferenza primitiva del sistema volvente (ruote) sforzo o spunto, che dev'essere superato per la messa in moto del meccanismo.

P1 = è lo sforzo periferico totale, corrispondente a V, agente sulla circonferenza primitiva della ruota (pignone o puleggia di comando), maggiorato di "C" e delle resistenze passive della trasmissione, precisamente del:

10% per gli attriti degli assi di comando e di rinvio
 15% per ogni coppia d'ingranaggi di riduzione
 50% se la riduzione è costituita da un riduttore a vite ad elica

Q = è il peso della catena, tapparelle, piastre, tazze, per metro lineare

q = è il peso del materiale, per metro di trasportatore (sabbia, polveri, carbone, ecc.)

N = potenza espressa in HP occorrente = $\frac{P1 \times V''}{75}$

la potenza necessaria ottenuta sarà poi, eventualmente maggiorata a seconda delle casualità, per tener conto dei sovraccarichi in partenza, ecc.

Q1 = potenza d'elevazione o portata in tonn./h
 $3,6 \times g \frac{P \times V''}{d} e p = \frac{d Q1}{3,6 \times g \times V''}$

g = grado di riempimento tazze = 0,7/0,8 per materiali polverosi, e 0,4/0,5 per materiali di pezzatura grossa o media

d = distanza, tra una tazza e l'altra, espressa in metri

The identification of engine stress, which is present both in transporters and in chain elevators, must be studied in order to project and develop transmission with roller chains. Strains, torsions and bends, if present, have to be neutralized during design.

Below, meaning of letters and symbols used in the formula:

α = angle of inclination of transporter or elevator
 C = additional traction for flat-top chains and cups sliding

F = coefficient of sliding friction, between chains and guides (see table)

RF = coefficient of rolling friction (see table)

F1 = coefficient of sliding friction between goods to transport (sand, dust of glass, carbons...) and races of transporter.

L = length of transporter or elevator, between the center of controlling wheel and center of "returning" wheel, expressed in mts.

P = peripheral stress expressed in kg. It works on wheels pitch line: this stress has to be surpassed to start the mechanism

P1 = total peripheral stress, equal to V, working on wheel pitch line (sprocket or driving pulley) increased by "C" and by passive resistances of transmission. In detail:

10% for friction of return and control axles

15% for each couple of reduction gear

50% if reduction derives from a worm reduction unit or a propeller reduction unit

Q = weight of chain, flat top chains, plates, cups, for linear meter.

q = weight of material, for meter of transporter (sand, dusts, carbon...)

N = power in HP = $\frac{P1 \times V''}{75}$ the power obtained can be uprated in some cases: initial over loads for example.

Q1 = elevation power or capacity load in tonn/h

$3,6 \times g \frac{P \times V''}{d} e p = \frac{d Q1}{3,6 \times g \times V''}$

g = level of cups filling = 0,7/0,8 for dusting materials and 0,4/0,5 for medium or big size materials

d = distance, between one cup and the other, expressed in meters

$V'' =$ Velocità espressa in m/sec, è $= 0,105 \times R \times n$; oppure:

$$\frac{(\pi D n)}{60}$$

$R_p =$ raggio primitivo della ruota di comando espressa in metri

$n =$ numeri di giri/minuto, della ruota comando

$p =$ peso in kg dei materiali che ogni tazza può contenere (considerandola piena) senza cioè tenere conto del calcolo del grado di riempimento "g"

coefficienti di attrito radente:

$F = 0,33$	fra metallo e metallo
$F_1 = 0,59$	fra metallo e carbone
$= 0,33$	fra metallo ed antracite
$= 0,53$	fra metallo e cenere (scorie umide)
$= 0,60$	fra metallo e sabbie
$= 0,59$	fra metallo e calcare
$= 0,33$	fra metallo e grano

coefficienti di attrito volvente:

$$RF = X \times \frac{d}{D} + \frac{2y}{D}$$

Dove:

$X = 0,33$ fra metallo e metallo (non lubrificato)

$X = 0,20$ fra metallo e metallo (lubrificato)

$D =$ diametro del rullo, espresso in mm.

$d =$ diametro del perno o della bussola intorno ai quali ruota il rullo (in mm.)

$y =$ mm. 0,75 fra metallo e metallo in condizioni medie

Valori di C:

Per elevatori verticali 0,15 ÷ 0,40 P

Per trasportatori inclinati 0,05 ÷ 0,15 P

Per trasportatori orizzontali 0,05 ÷ 0,10 P

Tensione nelle catenarie

Nel caso di un elevatore verticale a catene semplici, lo sforzo di tensione sarà uguale a quello rappresentato dallo sforzo motore P.

Ovviamente, nel caso di catenaria doppia, lo sforzo di tensione, in ogni catena, corrisponderà alla metà di quanto sopra indicato.

Nel caso di trasportatori orizzontali, lo sforzo di tensione sulle catene, sarà uguale allo sforzo di trazione nel caso della catena semplice, oppure corrisponderà alla metà di tale sforzo, nel caso di catena doppia.

Nel caso invece di trasportatori inclinati, si calcolerà lo sforzo della catena come somma degli sforzi prodotti dalla quota di peso del tratto portante e della quota del peso trasportato, purché l'inclinazione sia sufficiente affinché il tratto di ritorno possa scendere per semplice gravità. Se detta inclinazione fosse insufficiente, ed il tratto di ritorno debba essere forzato a scendere dalla ruota, allora si dovrà tener conto anche di questo sforzo.

Sforzo motore. Elevatori verticali

$$1) P = (q + Q) \times L$$

$V'' =$ speed expressed in m/sec is $= 0,105 \times R \times n$; or:

$$\frac{(\pi D n)}{60}$$

$R_p =$ primitive radius of controlling wheel, expressed in m

$n =$ number of revolutions per minute, of controlling wheel

$p =$ weight in kg of materials that every cup can contain (when full), without "g" degree of filling up

coefficients of grazing friction:

$F = 0,33$	between steel and steel
$F_1 = 0,59$	between steel and carbon
$= 0,33$	between steel and anthracite
$= 0,53$	between steel and ash (damp slags)
$= 0,60$	between steel and sands
$= 0,59$	between steel and limestone
$= 0,33$	between steel and wheat

coefficients of rolling friction:

$$RF = X \times \frac{d}{D} + \frac{2y}{D}$$

Where:

$X = 0,33$ between steel and steel (not lubricated)

$X = 0,20$ between steel and steel (lubricated)

$D =$ roller diam. expressed in mm

$d =$ diameter of pin or sleeve, around which rotates the roller (in mm)

$y =$ mm. 0,75 between steel and steel in medium conditions

C values:

For vertical elevators 0,15 ÷ 0,40 P

For slanting conveyors 0,05 ÷ 0,15 P

For horizontal conveyors 0,05 ÷ 0,10 P

Strech in catenary

In a vertical elevator with single strand chains, tension stress is equal to "P" stress engine. When the catenary is double, tension stress in every chain, is half of what above indicated. In horizontal conveyors, tension stress on chains is the same as the one of single strand chain or half of this stress if the chain is double.

In sloping conveyors the stress is in this way calculated: the sum of stress produced from the weight of bearing section and from transported weight. The inclination has to be sufficient and the returning way has to go down by simple gravity.

When this inclination is not enough and the returning section is forced to go down from the wheel, in this case we have to note this stress as well.

Engine stress. Vertical elevators

$$1) P = (q + Q) \times L$$

Ecco alcuni esempi:

ESEMPIO N. 1

Elevatori verticali:

Elevatore a tazze per carbone coke pezzatura media peso specifico circa kg 400 m³. Portata richiesta tonn 4,8 ora = 12 m³. Interasse dell'elevatore mt 10.

Fissati:

g = 0,5
d = mt 0,330
v = mt 1"
n = 40 a 1'
Rp = mt 0,250
Q = kg 5 (peso per mt di catena tazze, ganci, ect.)
q = kg 1,300 peso per mt dei materiale elevato

Il sistema di tensione è a vite, ma costruito razionalmente. 1 coppia di ingranaggi di riduzione con rendimento e = 0,85.

Assi montati su cuscinetti a sfere.

Calcolo portata:

$Q_1 = 3,6 \text{ g} \frac{p}{d} v''$ e quindi: $4,8 = 3,6 \text{ g} \frac{p}{d} \times l = 4,8 =$

$$3,6 \times 0,5 \times \frac{p}{0,330} \times l =$$

da cui:

$$p = \frac{d Q_1}{3,6 \times g \times v''} = \frac{0,330 \times 4,8}{3,6 \times 0,5 \times l} = \frac{1,58}{1,8}$$

= kg 0,880 (peso di ogni tazza teoricamente piena).

Infatti:

$$Q_1 = 3,6 \times 0,5 \times \frac{0,880}{0,330} \times l = 4,8 \text{ tonn/ora.}$$

Controllo della portata:

Per L = 10 mt = a 31,5 tazze a kg 0,880 cad.
= (x g = 0,5) = 0,440 kg cad.

Quindi N. 31,5 tazze x kg 0,440 = kg 13,325 per 10 mt di L.

Siccome la v elocità è di 1 mt" ne consegue che si eleveranno in 10 " kg 13,325 di mater iale, e quindi in 1" = kg 1,3325, e in un'ora kg 1,3325 x 3660," = kg 4,800.

Calcolo della potenza occorrente:

$$P = (q + Q) \times L$$

$$P_1 = P + C + \text{resistenze passive}$$

$$P = (q + Q) \times L = (1,300 + 5) \times 10 = \text{kg } 65 \sim$$

$$P_1 = 65 + C + (\text{resistenz e passive}) = (65 + 0,2 P) + 0,15 = (P + C) = 78 + (0,15 \times 78) = \text{kg } 90.$$

Conseguentemente:

$$N = \frac{P_1 \times v''}{75} = \frac{90 \times l}{75} = 1,2 \text{ HP potenza eff ettiva da applicarsi.}$$

ESEMPIO N. 2

Trasportatore orizzontale a tapparelle o a nastro che portano il materiale. Abbiamo da trascinare sopra di un piano lungo mt 10 a mezzo di catene con rulli di scorrimento non lubrificati (F = 0,33) del diametro di mm 100 e ruotanti intorno a degli assi di mm 38, un peso di kg 2000, dei quali kg 800 sono rappresentati dal peso della catena ed accessori (0) e kg 1200 dal carico (q).

Some examples:

EXAMPLE No 1

Vertical elevators:

Cups elevator for coke coal, medium size, specific weight kg 400 m³ more or less. Capacity 4,8 ton per hour = 12 m³. Distance betw een centers of ele vator 10 mt.

Fixed:

g = 0,5
d = mt 0,330
v = mt 1"
n = 40 a 1'
Rp = mt 0,250
Q = 5 kg (per cups chain mt, hooks, etc)
q = 1,300 kg per mt of raised material

Tension system is by screw, but rationally manufactured. 1 pair of reduction gears with efficiency e = 0,85. Axed assembled on roller bearings.

Calculation of capacity:

$$Q_1 = 3,6 \text{ g} \frac{p}{v} v'' \text{ theref ore: } 4,8 = 3,6 \text{ g} \frac{p}{d} \times l = 4,8 =$$

$$3,6 \times 0,5 \times \frac{p}{0,330} \times l =$$

from where:

$$p = \frac{d Q_1}{3,6 \times g \times v''} = \frac{0,330 \times 4,8}{3,6 \times 0,5 \times l} = \frac{1,58}{1,8}$$

= 0,880 kg (weight of every cup, full).

Infact:

$$Q_1 = 3,6 \times 0,5 \times \frac{0,880}{0,330} \times l = 4,8 \text{ tonn/hour.}$$

Check of capacity:

For L = 10 mt = a 31,5 cups of kg 0,880 cad.
= (x g = 0,5) = 0,440 kg each.

Therefore No 31,5 cups for kg 0,440 = kg 13,325 for 10 mt of L.

Speed is 1 mt", therefore in 10", kg 13,325 of materials will be raised in 1h 1" = 1,3325, in 1h kg 1,3325 x 3660," = kg 4,800.

Calculation of necessary power:

$$P = (q + Q) \times L$$

$$P_1 = P + C + \text{passive resistances}$$

$$P = (q + Q) \times L = (1,300 + 5) \times 10 = \text{kg } 65 \sim$$

$$P_1 = 65 + C + (\text{passive resistances}) = (65 + 0,2 P) + 0,15 = (P + C) = 78 + (0,15 \times 78) = \text{kg } 90.$$

Therefore:

$$N = \frac{P_1 \times v''}{75} = \frac{90 \times l}{75} = 1,2 \text{ HP effective power to apply.}$$

EXAMPLE No 2

Orizental flat top c hain conveyors or orizental belt conveyor to transport the stuff. A weight of 2000 kg has to be trasnported on a 10 mt. level: 800 kg are the weight of the chain and its accessory (o), the other 1200 kg. are the weight of the load (q). This level works thanks to chains with not lubricated sliding rollers (F = 0,33), of 100 mm diameter that rolls round mm 38 axles.

Applichiamo la formula: $P = (2 \times Q + q) \times (L \times RF) =$

$$\text{dove } RF = X \times \frac{d}{D} + \frac{2 \times y}{D} = 0,33 \times \frac{38}{100} + \frac{2 \times 0,75}{100} = 0,1606$$

$$P = (2 \times 80 + 120) \times (10 \times 0,1606)$$

$$P = (160 + 120) \times (1,606)$$

$$P = 280 \times 1,606 = \text{kg } 449.$$

Lo sforzo motore totale di trascinamento P_1 sarà eguale a P maggiorato come abbiamo visto precedentemente delle resistenze passive.

$$\text{La potenza } N \text{ da applicarsi, } N = \frac{P_1 \times v''}{75}$$

La potenza ottenuta sarà maggiorata a seconda dei casi, (lunghezza del trasportatore, natura del carico e del sistema di carico) sino ad una volta e mezzo per tenere conto dell'eventuale maggiore sforzo per avviamento sotto carico.

ESEMPIO N.3

Trasportatore inclinato a tapparelle portanti il materiale. Distanza fra i centri degli assi di comando e di rinvio mt 50. Inclinazione 23° .

Il peso Q del trasportatore a vuoto è, per mt 1 di kg 136. Il peso q del materiale da trasportare è per mt 1 di kg 297. Le catene hanno dei rulli lubrificati del diametro di mm 152.

I detti rulli ruotano attorno a dei perni di diametro di mm 38.

Quindi:

$$L = 50 \text{ mt}; \alpha = 23^\circ; \sin 23^\circ = 0,39; \cos 23^\circ = 0,92.$$

$$Q \text{ kg } 136; q \text{ kg } 297.$$

$$RF = 0,20 \times \frac{38}{152} + \frac{2 \times 0,75}{152} = 0,06.$$

Abbiamo tenuto $X = 0,20$ per rulli lubrificati.

Applichiamo la formula:

$$P = L (Q + q) \times [(\cos \alpha \times RF) + \sin \alpha] + (Q \times L) [(\cos \alpha \times RF) - \sin \alpha].$$

$$P = 50 \times (136 + 297) \times (0,92 \times 0,06) + 0,39 + (136 \times 50) \times (0,92 \times 0,06) - 0,39.$$

$$P = 21.650 \times (0,445) + 6.800 \times (-0,335).$$

$P = 9.634 - 2278 = 7356 \text{ kg}$ che è lo sforzo periferico agente sulla circonferenza primitiva delle ruote di comando. Lo sforzo motore così determinato dovrà essere aumentato delle resistenze passive e a seconda di quanto visti precedentemente, per ottenere P_1 .

$$\text{La potenza } N \text{ da applicare in HP sarà: } = \frac{P_1 \times v''}{75}$$

Bisognerà inoltre aumentare la potenza così ottenuta, a seconda dei casi, sino ad una volta e mezzo per tenere conto delle eventuali pendenze sotto carico. Precisiamo per questo esempio che lo sforzo torcente o sforzo periferico sarà dunque in kg 7356. Mentre la tensione totale sulle catene kg 9634 ($P + (L \times Q) \times \sin \alpha$) ossia ($7356 + (50 \times 136) \times 0,39$). Quella flettente per il calcolo degli assi sarà = a kg 11912 ossia $9634 + 2278$. Anche per i calcoli dei trasportatori precedenti bisognerà procedere come sopra, sempre facendo attenzione, se il tratto di ritorno scende per semplice gravità o meno. Nell'esempio sopra elencato abbiamo aggiunto la tensione delle catene, appunto anche questo sforzo dato che l'inclinazione non era sufficiente a fare scendere il tratto di ritorno per semplice gravità.

The formula: $P = (2 \times Q + q) \times (L \times RF) =$ must be used

$$\text{where } RF = X \times \frac{d}{D} + \frac{2 \times y}{D} = 0,33 \times \frac{38}{100} + \frac{2 \times 0,75}{100} = 0,1606$$

$$P = (2 \times 80 + 120) \times (10 \times 0,1606)$$

$$P = (160 + 120) \times (1,606)$$

$$P = 280 \times 1,606 = \text{kg } 449.$$

P_1 total stress engine of dragging is equal to P increased by passive resistances.

$$N. \text{ power to apply, } N = \frac{P_1 \times v''}{75}$$

The obtained power will be increased, case by case, (length of conveyor, kind of load and kind of loading system) up to 1 time and half to include possible greater stress in case of starting under load.

EXAMPLE No 3

Sliding flat top chain conveyor transporting material. Distance among centers of control axles and return 50 mt., inclination 23° .

The weight Q of an empty conveyor is for 1 mt of 136 kg. The weight q of stuff to transport is for 1 mt of 297 kg. Chains have lubricated roller of 152 mm. diameter. These rollers rotate round 38 mm. diam. pins.

Therefore:

$$L = 50 \text{ mt}; \alpha = 23^\circ; \sin 23^\circ = 0,39; \cos 23^\circ = 0,92.$$

$$Q \text{ kg } 136; q \text{ kg } 297.$$

$$RF = 0,20 \times \frac{38}{152} + \frac{2 \times 0,75}{152} = 0,06.$$

Where $X = 0,20$ for lubricated rollers.

The following formula has to be applied:

$$P = L (Q + q) \times [(\cos \alpha \times RF) + \sin \alpha] + (Q \times L) [(\cos \alpha \times RF) - \sin \alpha].$$

$$P = 50 \times (136 + 297) \times (0,92 \times 0,06) + 0,39 + (136 \times 50) \times (0,92 \times 0,06) - 0,39.$$

$$P = 21.650 \times (0,445) + 6.800 \times (-0,335).$$

$P = 9.634 - 2278 = 7356 \text{ kg}$ which is the peripheral stress acting on control wheels pitch line. The obtained engine stress has to be increased by passive resistances, as seen before, to get P_1 .

$$N \text{ power to apply in HP, will be: } = \frac{P_1 \times v''}{75}$$

Moreover the obtained power will be increased, case by case, up to 1 time and half to include possible starting under load. For this example, the twisting stress or peripheral stress is in kg 7356. Total stretch on chains is 9634 kg. ($P + (L \times Q) \times \sin \alpha$) that is ($7356 + (50 \times 136) \times 0,39$).

The bending tension of axles will be = 11912 kg whereas 9634 + 2278.

For calculations of previous conveyors, we have to proceed as above, important is to pay particular attention to way of returning section: if this descends for gravity or other. In our example; in fact, we had to add a further stress: the chains tension: the inclination wasn't enough to enable the returning section to descend for simple gravity.

TRASPORTO LEGGERO / LIGHT TRANSPORT

Ecco qui di seguito elencate, le normative basilari, osservate durante i processi produttivi. Sono fra i più alti esempi di standard qualitativi che fanno di ITC, un marchio d'altissima affidabilità e qualità.

MATERIALI:

- Catene standard al carbonio: tutti i componenti delle catene, subiscono un trattamento termico. Le parti assoggettate ad usura, quali perni e bussole, ad esempio, vengono ulteriormente indurite, con trattamenti di cementazione e tempra ad induzione, in atmosfera controllata, e se il caso lo richiedesse, su alcune di esse, verrebbe attuata anche una cromizzazione. Il controllo di laboratorio, garantisce l'efficacia totale di tutti questi processi di trattamenti protettivi.
- Altre tipologie di catene, subiscono trattamenti superficiali di differente potere protettivo:
 - Zincatura o zincocromatura
 - Tropicalizzazione
 - Nichelatura
 - Trattamenti galvanici speciali
- Catene in acciaio Inox (AISI 304 L)
Per la massima resistenza all'attacco di agenti chimici (anticorrosione).

PRESTIRAGGIO O PRECARICO:

Tutte le catene ITC, facenti parte della linea "TRASPORTO LEGGERO", vengono precaricate e rodate, secondo predeterminati criteri tecnomeccanici, per assicurare una corretta applicazione in ogni campo lavorativo, inducendo alle catene, la necessaria resistenza, contro usura, danneggiamenti ed allungamenti.

SPEZZONI E COMPOSIZIONI VARIE:

Per le applicazioni particolareggiate, richiedenti speciali impieghi, con tratti (rami) di catenarie con lunghi sviluppi e necessarie tolleranze sul totale dei medesimi, ITC fornisce catene spezzonate e/o composte, secondo le richieste dell'Utilizzatore, eseguendo oltre che l'operazione suppletiva di composizione dello spezzone, anche adeguati controlli sugli sviluppi stessi, contrassegnandone le zone di connessione, onde agevolare l'operazione di montaggio.

MANUTENZIONE E LUBRIFICAZIONE:

Tutte le catene ITC, della linea "TRASPORTO LEGGERO", vengono sottoposte a lubrificazione di carattere Standard, al momento del confezionamento ed imballaggio. Lubrificazioni specifiche, con oli e grassi particolari, possono venire eseguiti (a richiesta), con utilizzo di lubrificanti particolarmente adatti all'usura (Bisolfuro di molibdeno), alle alte temperature (220-240 °C).

CATENE SPECIALI SU SPECIFICHE DEL CLIENTE:

ITC produce qualsiasi tipologia di catena, destinata a qualsiasi comparto produttivo. Ogni tipo d'applicazione o problematica, viene risolta a livello produttivo, dai vari centri di produzione, evidenziati nelle fotografie, raffigurate nella prima parte di questo catalogo. A seguito di eventuali ulteriori accordi, ITC può produrre catene d'ogni tipo e formato, anche in regime d'**ESCLUSIVA**.

We would like to remind you, general and basic rules that are followed during production process: qualitative standards are the highest, in order to grant all our customers a reliable brand.

MATERIALS:

- Standard carbon chains: all chains components, are thermally treated. Part usually more exposed to wear (sleeves and pins for example) are even more hardened with casehardening and induction hardening operations. These treatments take place in a controlled atmosphere and if necessary a further chromizing operation could occur. A laboratory control guarantees the total efficacy of all these protective operations.
- Other chains are superficially treated with different protective operations:
 - galvanizing or zinc-chromium plating
 - tropicalization
 - nickel-plating
 - special galvanic treatments
- Stainless steel chains (AISI 304 L)
For the highest resistance against chemical agents (anticorrosion)

PRE-STRETCHING OR PRE-LOADING:

All ITC chains, belonging to "LIGHT TRANSPORT" are pre-loaded and broken in, in accordance with technical-mechanics rules which assure a correct application in every field of working. In this way all chains have a great resistance against wear, elongations and damages.

CUT DOWN SIZES AND DIFFERENT COMPOSITIONS:

For special applications, where very long chains and particular tolerances are presents, ITC can supply you with cut down size chains and/ or chains as per customers requirements. Infact besides cutting the chains as per request, ITC executes all controls on them and indicates the connection parts, to facilitate mounting operation.

UPKEEP AND LUBRICATION:

All ITC chains belonging to "LIGHT TRANSPORT" are previously treated with standard lubrication, during packing operation. Special lubrications with particular oils and grease, can be, under request, executed: lubricants suitable for high temperatures (220-240 °C) and against wear (bisulphide of molybdenum) can be used.

SPECIAL CHAINS AS PER CUSTOMER'S REQUIREMENT:

ITC produces all types of chains, for all types of productive compartment. Any kind of application or problem is solved during productive level from different production centers, that are showed with pictures in the first part of this catalogue. If further agreements are presents, ITC can produce any type of chain also with **EXCLUSIVITY**.

TRASPORTO LEGGERO / LIGHT TRANSPORT

CATENE A RULLI “SERIE ISO” (Norme europee) “ISO SERIES” ROLLER CHAINS (European rules)

Questa denominazione, raggruppa quelle catene a rulli, abitualmente costruite secondo precise normative, adottate dall'unificazione di sistemi tecnologici e di misurazione, di alcuni Paesi europei, fra i quali l'Italia, la Francia, la Germania ed il Regno Unito.

L'unificazione di questi sistemi (ISO/R 606-1982/DIN 8187), consente la totale eliminazione di divergenze costruttivo-dimensionali, fino ad ora esistenti, fra le catene a rulli costruiti nei vari Paesi europei, con l'ottenimento di una coerente e vantaggiosa equivalenza, facilitandone al tempo stesso una logica e meno costosa intercambiabilità. Le catene a rulli della “SERIE ISO” sono quelle con il maggior impiego in Europa, per le trasmissioni di potenza. Queste catene della “SERIE ISO” sono costruite, quindi disponibili da standard, con 1, 2, 3 ed anche 4 file di rulli.

This name includes all roller chains that are normally manufactured in accordance with accurate rules accepted and recognized by some European countries, such as Italy, France, Germany and U.K. The unification of these technological and measuring systems (ISO/R 606-1982/DIN 8187), eliminates any manufacturing difference previously existing among roller chains constructed in different European countries.

In this way the product is interchangeable and equivalent. “ISO SERIES” chains are the most used in Europe for power transmission: these can be standard, single-double-triples strands or even with 4 strands of rollers.

Es.: catena ad 1 fila di rulli (semplice)

Example: single strand roller chain

Es.: catena a 2 file di rulli (doppia)

Example: double strands roller chain

CATENE A RULLI “SERIE AMERICANA” (ANSI-ASA) “AMERICAN SERIES” ROLLER CHAINS (ANSI-ASA)

Sono costruite secondo l'unificazione Americana, denominata (ANSI B 29.1) e, si propone, come alternativa alle corrispondenti della “Serie ISO” sopra riportate. Per facilitarne i criteri di scelta, vengono abitualmente elencate e raffigurate separatamente da quelle della “Serie ISO”, sebbene il loro campo applicativo è pressoché identico a queste, col vantaggio però, rispetto alla “Serie ISO”, derivante da una maggiore resistenza alla fatica, dovuta alla loro caratteristica progettuale. Caratteristica che ha reso il sistema unificato “ANSI B 29.1”, largamente adottato anche in Europa.

Per facilitarne l'appellativo, denomineremo le catene di questa unificazione Americana, con la sigla “ASA”. Le catene a rulli ITC della serie “ASA”, normalmente sono disponibili, come per la “Serie ISO”, ad 1, a 2, 3 ed anche 4 file di rulli.

Manufactured in accordance with the American unification, they are an alternative to “ISO series” above named. To make their choice easier, these chains are separately indicated even if their application field is almost the same as “ISO series”: the main difference is their higher endurance to stress, coming from a planning characteristic. Thanks to this characteristic the “ANSI B 29.1” system, is widely used in Europe too.

We call this chains “ASA”, and the “ITC” chains of “ASA” series are the same as above: standard, single-double-triple strands or even with 4 strands of rollers.

TRASPORTO LEGGERO / LIGHT TRANSPORT

I prodotti "ITC" sono da sempre in costante perfezionamento.

Da sempre "ITC" rivolge particolare attenzione verso investimenti, tendenti a valorizzare la qualità e l'affidabilità dei suoi prodotti, a totale garanzia di un corretto funzionamento.

Tutto questo ha consentito ad "ITC" di perfezionare piani di sviluppo e di progettazione dei propri prodotti, migliorandone i già elevati standard qualitativi, ampiamente riconosciuti dall'elevato numero di utilizzatori, sparsi in tutto il mondo.

Processo produttivo, controllo dimensionale e funzionale, lubrificazione e collaudo, e per finire confezionamento e relativo imballaggio, sono un tutt'uno, che s'identifica nell'**ALTA QUALITÀ** oramai raggiunta da "ITC", che ha di recente ottenuto la certificazione "ISO 9002" rispondente ai più rigidi canoni di controllo.

The "ITC" products have always been in continuous improvement, "ITC" attaches particular importance to investments, in order to improve and develop the quality and reliability of its products for a total safe working. In this way "ITC" is constantly perfecting development designs and projects for its products, improving therefore the already high qualitative standards, widely known from many users all around the world.

Productive process, dimensional and functional control, lubrication, acceptance test, and packing are carefully carried out to obtain high quality in which "ITC" identifies itself.

"ITC" has recently obtained the "ISO 9002" quality system certification, to guarantee all the customers a product manufactured in accordance with the strictest rules.

MODALITÀ D'IDENTIFICAZIONE DI UNA CATENA A RULLI “ITC” CON ATTACCHI

IDENTIFICATION OF AN “ITC” ROLLER CHAIN WITH ATTACHMENTS

Gli attacchi sotto raffigurati, possono essere assemblati, su di 1 solo lato, oppure sui 2 lati della catena “ITC”. È inoltre possibile identificare questi attacchi, utilizzando le designazioni sotto riportate:

The following attachments can be assembled on one side or on both sides of “ITC” chain. To identify these attachments the following designations can be used.

Attacchi da 1 solo lato / One side attachments	E1	E2	EM35	EM35-2	Etc.
Attacchi sui 2 lati / Both sides attachments	EK1	EK2	EM1	EM2	Etc.

E1**EK1****E2****EK2****EM35****EM1****EM35-2****EM2**

Quando però l'attacco, non è un'aletta, ma bensì un perno sporgente, la sigla d'identificazione muta come da suggerimento sotto riportato:

ED1 = ovvero quando l'attacco (in questo caso per no sporgente) è costituito da 1 pezzo per ogni maglia.

ED2 = ovvero quando l'attacco (in questo caso “perno sporgente”) è costituito da 2 pezzi per ogni maglia.

When the attachments is not a “attachment linkplates” but a extending pin, the designations are the following:

ED1 = the attachment (extending pin) is formed by 1 pcs for each link.

ED2 = the attachment (in this case “projecting pin”), is formed by 2 pcs for each link.

**ED1****ED2**

TRASPORTO LEGGERO / LIGHT TRANSPORT

CATENE A RULLI, PER CURVE (serie SIDE BOW) (SIDE BOW series) ROLLER CHAINS

Si tratta di catene a rulli; snodabili nei piani verticale ed orizzontale.

Comunemente utilizzate come catene per trasporto, nel caso si debbano eseguire particolari percorsi curvilinei, fino a r aggiungere curve di 180°, od anche, per la motorizzazione di rulli per trasportatori con tappeti a percorso curvilineo.

Su richiesta, si possono fornire catene con attacchi speciali.

These are untied roller chains on both vertical and horizontal surface. Normally used as chains for transport and especially requested when curvilinear ways are present, these chains can reach 180° curves.

They are also suitable for the motorization of rollers for conveyors with curvilinear way.

Under request, chains with special attachments can be supplied.

CATENE A RULLI, CON O-RING ROLLER CHAINS WITH O-RING

Negli impieghi critici, laddove la lubrificazione richiesta è di vitale importanza, il sistema di sigillatura delle parti sottoposte ad usura, fra perni e bussola, è salvaguardato dall'adozione della guarnizione ad anello "O-Ring". Tale applicazione si rende necessaria nel caso in cui, non sia possibile attivare la lubrificazione tradizionale.

Where uses are critic and lubrication is very important, the sealing system of the parts under wear and tear (between pins and sleeve) is protected by using the "O-Ring" seal. This application is necessary when the traditional lubrication cannot be performed.

TRASPORTO LEGGERO / LIGHT TRANSPORT

CATENE A RULLI, CON TRATTAMENTO DI NICHELATURA SUPERFICIALE ROLLER CHAINS, WITH SUPERFICIAL NICHEL-PLATED TREATMENT

Trattasi di catene tr attate superficialmente e con caratteristiche di resistenza all'ossidazione ed alla corrosione, assai vicine, come efficacia, alla qualità delle catene INOX, rispetto alle quali però, presentano carichi di rottura e di lavoro, assai più elevati, uguali, per resistenza, a quelle in acciaio legato e/o al carbonio. Dette catene, sono da impiegarsi in condizioni ambientali assai difficili, in presenza di agenti aggressivi, e nei casi in cui, la sollecitazione alla resistenza ad attacchi di liquidi ed acidi, renda necessaria una protezione superficiale dei componenti, pur non alterandone le connotazioni tecnico-meccaniche.

These chains are superficially treated to increase their resistance to corrosion and oxidation, becoming in this way very similar to stainless steel types. The most important difference from those is their greater capacity of standing higher breaking load and loads, quality that usually belong to steel and/or carbon chains. These chains are usually assembled in very difficult working conditions, where aggressive agents are present or when the resistance against acids and liquids involves a superficial protection of components (techno-mechanics characteristics do not change).

CATENE A RULLI, CON PIASTRE A PROFILO DIRITTO

ROLLER CHAINS WITH STRAIGHT SIDE PLATES

Particolarmente adatte all'utilizzo in applicazioni, laddove si renda necessario trasportare scatole, o cartoni in genere, pallets.

Dette catene, scorrendo sulle piastre, strisciando, evitano eventuali danneggiamenti alle parti a contatto con essa, dei colli trasportati.

Particularly suitable for pallets, boxes and cardboards transports.

These chains slide on plates, avoiding therefore possible damages of transported packages.

CATENE SPECIALI PER MACCHINE TERMOFORMATRICI SPECIAL CHAINS FOR THERMOFORMING MACHINERIES

Ideate per il trasporto di films in poliuretano, queste catene (di passo 1/2x5/16), vengono utilizzate nelle macchine per l'imballaggio di prodotti alimentari, riviste, ed imballaggi in genere, laddove venga richiesta la "termo formatura a vuoto".

Suitable for polyurethan films transport, these chains (their pitch is 1/2x5/16) are utilized in machineries for package of any kind (foods and magazines for example) where "vacuum forming" is required.

Di diverso spessore e consistenza può essere il film, o pellicola da trasportare, mentre per quanto concerne i componenti di detta catena, da ricordare che la "catena base" è prevista in Acciaio Nikelato superficialmente, mentre le "pinze e" laterali sono pre viste in Acciaio inossidabile.

The films can have a different thickness or consistence whereas concerning chain components, the "standard chain" has its surface made of nickel-plated steel and its lateral "pliers" made of stainless steel.

CATENE CON CAVALLOTTI "ITC" VULCANIZZATI CHAINS WITH "ITC" VULCANIZED BENT - ATTACHMENTS

Il concepimento di queste catene, è dettato soprattutto dalla particolarità dell'impiego nell'industria vetraria, laterizi e del legno, laddove l'esigenza di un appoggio gommato, vulcanizzato su di una catena di base, risolve ampiamente le problematiche inerenti a tali applicazioni.

These chains are suitable for any application requiring a rubbered support, vulcanized on a standard chain. These types are particularly requested in glass industry, tiles and wood factories.

CATENE CON CAVALLOTTI “ITC” VULCANIZZATI **CHAINS WITH “ITC” VULCANIZED BENT - ATTACHMENTS**

Per talune applicazioni, e sostanzialmente per le catene a doppia fila di rulli, il cavallotto, può essere fornito, senza il piattello vulcanizzato in gomma.

For some applications, mainly concerning double strand roller chains, bent attachment can be supplied without vulcanized cup in rubber.

CATENE A RULLI “ITC” CON “passo lungo” “ITC” ROLLER CHAINS WITH “LONG-PITCH”

Catene di derivazione esecutiva dalle tipologie Europea ed Americana, dalle quali differiscono per le dimensioni del passo, che è doppio, pur mantenendo inalterate le dimensioni dei perni, bussole e rulli integrali, equivalenti alle grandezze corrispondenti.

Solitamente, trovano impiego per la loro semplicità, ed economicità, in trasmissioni aventi interassi particolarmente lunghi, e con carichi e velocità di valore relativamente contenuto.

These chains come from European and American types: pins, sleeves and integral rollers dimensions are identical, whereas the pitch changes, it's in these case double. Usually because of their very low costs and simplicity, are assembled in transmissions having very long distance between centers, low speeds and light loads.

Il perno “ED1”, può essere fornito, a richiesta, per esigenze particolari, con dimensioni e lunghezze variabili.

“ED1” pin can be supplied, under request, with different dimensions and lengths.

Il perno “ED1”, può essere fornito, a richiesta, completo di foro per copiglia, posto nella sua parte sporgente.

“ED1” pin can be supplied, under request, with a hole for split pin inserted in its extending part.

CATENE A RULLI A “PERNI FORATI” ROLLER CHAIN WITH HOLLOW PINS

Catene costruite col preciso intento d'aiutare l'utilizzatore, nell'adozione di attacchi personalizzati, comodamente adattabili, a queste catene, secondo le normative unificate.

Nota: Tutte le dimensioni indicate, sono espresse in mm.

Especially manufactured to help the users in adopting different attachments, easily adaptable in accordance with unified rules.

Note: All dimensions are expressed in mm.

AGRICOLTURA / AGRICULTURE

CATENE A RULLI “SERIE AMERICANA RINFORZATA” (ANSI H) “AMERICAN REINFORCED SERIES” ROLLER CHAINS (ANSI H)

Derivate dalle catene a rulli “Serie Americana”, sono distinguibili da queste, esclusivamente per lo spessore delle piastre.

Lo spessore delle piastre delle catene sotto raffigurate, fa sì che quest'ultime, vengano preferite all'impiego di trasmissioni con carichi a strappi, assai valide per l'impiego agricolo, nelle fresatrici ad esempio.

Non si tratta di catene con unificazione ISO.

The thickness of plates, marks the difference for these reinforced chains from the “American series” from which they derive. The thickness of chain plates, indicated below, grants a greater adaptability in transmissions with tearing loads: they are particularly used in agricultural sector, milling machines. These chains are not ISO unified.

Versioni alternative:

- Coppigliata da 1 o 2 lati
- Esecuzione fori su pale raschianti
- Acciaio inossidabile

• Dimensioni libere

* Senza pale raschianti

Alternative types:

- Split pin on one side or both
- With holes on scraping shovel
- Stainless steel

• Free dimensions

* Without scraping shovel

Ruote dentate su richiesta.
Gears available under request.

CATENE TOP LINE / TOP LINE CHAINS

RETTILINEE CON TAPPARELLE IN ACCIAIO “STRAIGHT LINE TOP” “STRAIGHT LINE TOP” WITH STEEL FLAT-TOP CHAINS

In funzione del tipo d'applicazione, le catene della linea “Straight line top” sono fornibili in materiali diversi. Per la resistenza più elevata all'usura, è preferibile la versione in Acciaio al carbonio bonificato (es. settori vetrario, ceramico e generalmente nei trasporti interni). Per particolari esigenze di resistenza all'usura, per impieghi ancor più probanti (percorsi abrasivi e velocità di scorrimento particolarmente elevate) è consigliata la versione in Acciaio carbonitrato. Per l'industria dell'imbottigliamento invece è consigliata la versione in Acciaio inox ferritico, mentre per la massima resistenza a corrosione, è possibile fornire la versione in Acciaio inossidabile austenitico.

“Straight line top” chains can be supplied with different materials as per type of application. To obtain an higher resistance against wear the “hardened and tempered”, carbon steel type should be used (ex. glass sector, tiles sector and inner transports). To even more heavy applications and to even more resistance against wear (very high sliding speeds and abrasive ways) the carbonitrate steel carbon version is recommended. For bottling industry the ferritic stainless steel type should be used, whereas for maximum resistance against corrosion the austenitic stainless steel has to be mounted.

– Per tutte le catene in acciaio inossidabile il carico di snervamento allo 0,2% è tale da garantire l'appartenenza al grado 1 della specifica ISO 4348 (il carico di snervamento è la caratteristica più importante ai fini della resistenza ai sovraccarichi). Larghezze non indicate in tabella solo su richiesta.

– For all stainless steel chains, the 0,2% yield point grants the first grade of ISO 4348 requirements (yield point is the most important characteristic against over-loads). Width not indicated above, available only under request.

Fornite in confezione da 80 passi (3,048 m).
Supplied with 80 pitch (3,048) boxes.

RETTILINEE CONTAPPARELLE IN ACCIAIO "STRAIGHT LINE TOP"
"STRAIGHT LINE TOP" WITH STEEL FLAT-TOP CHAINS

Le catene a rulli con tapparelle in acciaio, garantiscono elevate capacità di carico e scorrevolezza. Sono particolarmente indicate dove le caratteristiche principali dell'applicazione sono carichi elevati e velocità. La versione "E844", differisce dalla "E1864" per il diverso montaggio delle tapparelle: saldate sulla E844 e fissate a scatto sulla E1864 e perciò sostituibile.

Roller chains with steel flat-top chains, grant great load ability and smoothness: they are particularly suitable for applications where very high rotation speeds and heavy loads must be stood. "E844" version is different from the "E1864", because of a different assembling of flat-top chains: in fact they are welden on E844 whereas they are assembled by release on 1844, which are therefore replaceable.

Supplied with 160 pitch (3,048 m) boxes.

CATENE TOP LINE / TOP LINE CHAINS

CURVILINEE CON TAPPARELLE IN ACCIAIO “CURVE TOP” “CURVE TOP” WITH STEEL FLAT-TOP CHAINS

La proverbiale duttilità delle catene in acciaio della linea “CURVE TOP” per percorsi curvilinei, garantisce la massima funzionabilità, anche nelle applicazioni meno propizie, risolvendo ampliamenti, problemi d'ingombro e collocazione all'interno di vari reparti produttivi.

Anche in questo caso, variegata è la possibilità di utilizzare diversi tipi di materiale, la cui scelta è, ovviamente, finalizzata alle varie tipologie d'applicazione. Qui di seguito vi presentiamo le varie opportunità della gamma “ITC-CURVE TOP”.

“Curve top” steel chains are specially suitable for curvilinear ways and for particular applications where encumbrance and placing problems are present.

Once again there is a possibility of choosing different types of material: this is obviously determined by application field.

Here we enumerate the type of “ITC CURVE TOP”.

CATENE TOP LINE / TOP LINE CHAINS

CURVILINEE CON TAPPARELLE MAGNETICHE IN ACCIAIO
“CURVE TOP”

“CURVE TOP” WITH MAGNETIC STEEL FLAT-TOP CHAINS

Le catene della serie 981 MGN, costruite in materiale speciale, sono particolarmente indicate per essere utilizzate nei trasportatori curvilinei, laddove sono richiesti avvolgimenti ed ancoraggi magnetici.

Consentono, fra l'altro, d'essere sollevate dalla guida di scorrimento, per l'esecuzione della pulizia, o per semplici esplorazioni, senza doverne eseguire lo smontaggio.

Chains of 981 MGN, series are made of special materials and particularly suitable for winding and magnetic attachments. They can be lifted from their guide to be cleaned or when an exploration without dismounting is necessary.

All pins are in austenitic stainless steel

Fornite in confezione da 80 passi (3,048 m).
Supplied with 80 pitch (3,048 m) boxes.

CATENE TOP LINE / TOP LINE CHAINS

CURVILINEE CARDANICHE IN RESINA “CURVE TOP” “CURVE TOP” CARDANIC RESIN CHAINS

Le caratteristiche più evidenti delle catene cardaniche “TOP LINE”, sono la flessibilità, e la multidirezionalità. Concepite per curvare sia sul piano verticale che in quello orizzontale, permettono una grande varietà di configurazioni.

La compattezza del raggio di curvatura, consente di progettare trasportatori particolarmente compatti, permettendo altresì, la costruzione di rami particolarmente tortuosi e ricchi di curve in serie, diminuendone al tempo stesso l'attrito.

“TOP LINE” cardanic chains have as their most important characteristic the flexibility and multi-direction. Especially studied for bending both on vertical and horizontal surface, they enable a great variety of configurations the compactness of sideflex radius, enables the creation of very close conveyors.

Thanks to this, friction is reduced by many curves and winding ways.

CATENE TOP LINE / TOP LINE CHAINS

CURVILINEE CON TAPPARELLE IN RESINA "CURVE TOP" "CURVE TOP" WITH RESIN FLAT-TOP CHAINS

Con la scorrevolezza e planarità delle tapparelle in resina "TOP LINE", è possibile la progettazione di trasportatori con lunghi sviluppi e velocità periferiche, maggiori rispetto a quelli utilizzando normali catene a semplici tapparelle cernierate.

Thanks to the smoothness and flatness of "TOP LINE" resin flat-top chains, it is possible to project conveyors with longer dimensions and higher peripheral speeds, than normal flat-top chains.

CATENE TOP LINE / TOP LINE CHAINS

CURVILINEE CON TAPPARELLE IN ACCIAIO “CURVE TOP” “CURVE TOP” WITH STEEL FLAT-TOP CHAINS

Le catene a rulli con tapparelle ad elevata capacità di carico e scorrevolezza, garantiscono particolare affidamento anche per la continuità del piano di trasporto. Particolarmente indicate per velocità e carichi elevati, adottano un particolare cavallotto, con sagomatura specifica per facilitare lo scorrimento con assenza d'impuntamenti.

Roller chains supplied with flat-top chains with high loading and smoothness capacity, are suitable for the continuity of transport plane.

Particularly indicated for high speeds and heavy loads, they are supplied with a special bent-attachment, having a specific shaping to facilitate sliding without lockings.
